

**AMENDMENTS TO THE CLAIMS:**

This listing of claims will replace all prior versions and listings of claims in the application:

Claims 1-13. (Canceled).

14. (Currently Amended) A method of embedding identification information in a main body of data of a digital record medium by using an error correction technology comprising;

error correction encoding to digital data including digital contents to correct the error occurring in the transmission line with which the main body of data is obtained;

embedding the identification information to a part of said main body of data to which an error correction encoding is performed based on position information; and

embedding the position information to a part of said main body of data to which an error correction encoding is performed; and

storing said main body of data including said embedded identification information into said digital record medium.

15. (Previously Presented) The method according to claim 14, wherein said identification information is embedded to a data part stored in an area where control information of contents data in a record area is recorded.

16. (Canceled).

17. (Currently Amended) The method according to claim 14, wherein  
said identification information has a plurality of partial identification information;  
an information to acquire ~~[[an]]~~ the embedded position of said identification  
information has an initial value information, an embedded position information indicating an  
embedded position of said plurality of partial identification information, and a plurality of  
position information to acquire a position of said embedded position information;  
a first position information to acquire the position of said embedded position  
information is recorded at a position obtained by converting said initial value information by  
a predetermined function or a position shown by a position obtained as a result of the  
conversion; and  
a second or later position information is recorded in another position of the position  
obtained by converting a storage information of a position of a result when an information  
stored at another position of a side where said position information is not stored is further  
converted by said predetermined function in any positions obtained by a conversion result  
of said predetermined function, or a storage information at a position indicated to a position  
of a result of conversion one by one.

18. (Currently Amended) The method according to claim 14, wherein  
said identification information has a plurality of partial identification information;  
an information to acquire an embedded position of said identification information  
has an initial value information, an embedded position information indicating ~~[[an]]~~ the

embedded position of said plurality of partial identification information, and a plurality of position information to acquire a position of said embedded position information;

an initial position information is recorded at a position obtained by converting said initial value information by a predetermined function or a position shown by a position obtained as a result of conversion by said predetermined conversion formula; and

a position information after that is recorded at a position based on a data recorded by a predetermined distance at a position indicated by a position information obtained immediately before or a distance obtained by a predetermined conversion formula, or a position obtained by converting a position information obtained immediately before by a predetermined conversion formula.

19. (Previously Presented) The method according to claim 14, wherein an embedded position of said identification information is given by a table form.

20. (Previously Presented) The method according to claim 14, wherein said presentation target data is scrambled or encoded to make said identification information a key before an error correction encoding is performed.

21. (Currently Amended) A method of extracting an identification information from a main body of data of a digital record medium in which includes embedded identification information and position information by using an error correction technology comprising;

reading said main body of data in which includes embedded identification information from said digital record medium;  
extracting said identification information from the main body by an error correction decoding based the position information; and  
error correction decoding the main body of data after extracting said identification information in which original digital data is obtained.

22. (Currently Amended) A method of embedding identification information in a main body of data of a digital record medium by using an error correction technology comprising;

encrypting digital data including digital contents by using said identification information;

error correction encoding to said encrypted digital data including digital contents to correct the error occurring in the transmission line with which the main body of data is obtained;

embedding the identification information to a part of said main body of data to which an error correction encoding is performed based on position information; and

embedding the position information to a to a part of said main body of data to which an error correction encoding is performed; and

storing said main body of data including said embedded identification information into said digital record medium.

23. (Previously Presented) The record medium according to claim 22, wherein said identification information is embedded to a data part stored in an area where control information of contents data in a record area is recorded.
